A lternanthera

Alternanthera brasiliana Purple Prince

PLANTATION: Sow the seeds 12 to 14 weeks before the last frost. Keep the temperature between 20 °C and 22 °C. Germination time is between 7 and 14 days. Do not cover seeds: need light for uniform germination. Allow media to dry slightly between watering's without wilting. Water early in the morning to allow foliage to dry. Moderate fertilization levels are required. Long days (>14 hrs) will promote early flowering.

SOL: Indoor: A well-drained, porous sowing media is best to prevent overwatering.

Outdoor: Well-drained soil.

PLANTING:

Step 1: plow the soil about 30 cm (12 inches). Add an equal part of potting soil and mix well. Dig a hole approximately the same length as the container and about 1 ½ to 3 times the width.

Step 2: slightly squeeze the container, tap out the plant, and delicately free the roots. If the roots are too dense, liberate the fibers by inserting a knife or a transplanter. Separate the roots carefully, and then place in the hole.

* **Good to know:** Use an organic bone meal or a «soil activator» when transplanting to stimulate root development. Follow the instructions for use on the package.

Fill up the hole with garden soil. Slightly press the soil around the base of the plant to favor the contact between the roots and the soil. Water regularly every 2 or 3 days until the soil is well compacted.
