

GROWER'S FACTS

W.H.PERRON 

C hervil Curled

67-2510-01N

PLANTATION: Indoor: for early consumption, the seeds are sown in April. Chervil seeds require temperatures of around 5 to 7 °C. emergence are rapid, between 8 and 12 days.

Outdoor: Sow it in place from May to mid-September.

SOIL: Indoor: a well-drained, porous sowing media is best to prevent overwatering.

Outdoor: it requires a light soil, relatively rich in humus, cool and well drained to produce abundant foliage.

SPACING: sow in combs 25 cm apart. A small thinning to 10 cm on the row is sometimes necessary thereafter.

CULTURAL PRACTICES: hoe weeds regularly if the soil is dry to facilitate water infiltration. For continuous production, make successive sowings every three weeks. The first and last seedlings will prefer a sunny exposure, but seedlings made in summer will do best in the shade. Flowering and rising to seeds will thus be delayed.

HARVEST: about six weeks after sowing, picking begins! Cut the leaves as needed. Chervil, like many aromatics, keeps quite well in the freezer. When the small umbels appear, you can stop harvesting the foliage: the leaves are tastier before flowering.
